**THE FOLLOWING IS AN EXAMINER'S STATEMENT OF REASONS FOR
ALLOWANCE:**

A. It is noted that the claims have been renumbered so that all claims depend from a subsequent claim. Specifically, claim 31 has been renumbered to final claim number 1; claims 14-20 have been renumbered to final claim numbers 2-8; and claims 22-28 have been renumbered to final claim numbers 9-15.

B. The closest prior art of St. Clair teaches methods for determining whether a subject is at increased risk for developing colon cancer wherein the method comprises detecting the presence of a mutation in the MnSOD gene as indicative of an increased risk for developing colon cancer (see columns 2 and 4). In particular, St. Clair teaches a polymorphism in the promoter region of the MnSOD gene which is associated with decreased MnSOD activity (see, for example, Figure 4 and column 4). Ambrosone teaches that homozygosity for the -9 alanine allele of MnSOD is associated with increased risk of breast cancer in premenopausal women. However, the present claims are allowable over the prior art because the prior art does not teach or suggest the claimed methods for determining relative age-related risk of colorectal cancer in Hispanic subjects by detecting the presence of an alanine at position -9 of the MnSOD signal peptide.
